

BEHIND THE FINISH: STAIN FINISHING PROCESS

Our stain finishes are built through a carefully layered process that enhances the natural character of the wood while developing depth, consistency, and lasting protection.

STEP	PROCESS	WHAT IT DOES
01	Raw Wood Sanding	The wood is carefully sanded to create a smooth, clean surface and prepare it for stain.
02	Stain Application	Stain is evenly applied to develop the desired color while allowing the natural wood grain to remain visible.
03	Light Sanding	The surface is lightly sanded to refine the finish and prepare it for the protective layers that follow.
04	Clear Sealer	A clear sealer is applied to protect the stained surface and begin building depth and durability.
05	Intermediate Sanding	The sealed surface is sanded smooth to remove imperfections and create an even foundation.
06	Second Clear Sealer	An additional sealing layer further builds the finish and helps create a consistent surface.
07	Fine Sanding	A finer sanding process prepares the surface for its final color refinement and topcoat.
08	Toning & Shading	Color is carefully adjusted as needed to create a balanced, natural, and consistent appearance.
09	Protective Topcoat	A final clear topcoat seals the finish, adding durability and protection for everyday use.

Because wood is a natural material, variations in grain and color are expected and contribute to the unique character of each finished piece.
